

## Sustainable Raw Materials Policy

Technology advancement and the quality of life depend more and more on the materials they are built with. For electronics, materials help to reduce the product volume and weight, and enrich functionality for various user needs.

Sustainable raw materials management is a part of Acer's sustainable strategy. We are committed to minimizing the negative environmental and social impacts of raw materials in the product life cycle. Beginning with the use of recycled plastics, we are incorporating more recycled materials and further avoiding the use of raw materials from biodiversity sites. Acer's Sustainable Raw Materials Policy is as follows:

- Conduct the environmental and social impact assessment of raw materials, then formulate priority raw material lists to minimize negative environmental and social impacts.
- Expand the use of recycled materials and prioritize the use of sustainable raw materials certified by third parties.
- Work with the supply chain to investigate and avoid the use of raw materials from globally or nationally important biodiversity areas.
- Continuously collaborate with external stakeholders including research or advocacy organizations to promote the use of sustainable raw materials.
- Periodically disclose the progress of sustainable raw material use and plans.
